24 October 2026

Thursday paper digest, run on Saturday 24 October 2026. Two blind searches: stratospheric aerosol, and nuclear winter. Six most recent remit matches whose DOI links resolve, newest to oldest. Self-authored papers omitted. Preprints allowed. The published Sellitto et al. paper in Atmospheric Measurement Techniques is the same work as the EGUsphere preprint already filed on 28 September, so it is not repeated.

Papers

Canopy Structure Amplifies the Role of Radiation in Vegetation Responses Under Stratospheric Aerosol Injection [single-source]

Clark and Visioni (2026-10-20). EGUsphere (preprint).

https://doi.org/10.5194/egusphere-2026-6174

Optical properties of stratospheric aerosols from wildfires and volcanic eruptions constrained by satellite and ground-based lidars – Part II: Evolution of young plumes [single-source]

Soares et al. (2026-10-19). EGUsphere (preprint).

https://doi.org/10.5194/egusphere-2026-5644

Managed stratospheric aerosol injection phaseout under deep carbon removal: cross-model and aerosol-lifetime sensitivity [single-source]

Bily (2026-10-19). Research Square (preprint).

Why it might not fit: a preprint, and the question is phaseout under carbon removal rather than an injection experiment.

https://doi.org/10.21203/rs.3.rs-11247049/v1

Optical properties of stratospheric aerosols from wildfires and volcanic eruptions constrained by satellite and ground-based lidars – Part I: large scale evolution [single-source]

Soares et al. (2026-10-15). EGUsphere (preprint).

https://doi.org/10.5194/egusphere-2026-5639

Practical management challenges of stratospheric aerosol injection [single-source]

Miller (2026-10-15). Climatic Change.

Why it might not fit: management and governance, not a climate-model result.

https://doi.org/10.1007/s10584-026-04318-x

Governing Solar Radiation Modification in International Law: The Case for an International Climate Interventions Agreement and the African Union's Normative Response [single-source]

Addaney (2026-10-15). South African Yearbook of International Law.

Why it might not fit: international law, not climate or aerosol modelling.

https://doi.org/10.25159/2521-2583/21552

Items marked [single-source] appeared in only the stratospheric-aerosol search. The nuclear-winter search did not place a paper in these six. Held for a later digest: Qi et al. on compound dry-heat waves under G6sulfur (2026-10-07), and the PAGES note on volcanic eruptions and nuclear winter (2026-10-01). Buck et al., Anil et al., Wang et al., and Brunelli and Diamond are remit matches from this window, but doi.org returned 403, so they are not in this PDF.

Nomination

Clark and Visioni (2026-10-20) was nominated: https://doi.org/10.5194/egusphere-2026-6174

Dr. Doubt killed it. The open question aimed at the diffuse-to-direct ratio, which both land models already treat in the same direction. The cohort result is driven by lower total radiation relieving heat and water stress, and the two land models are not a canopy-only comparison. The idea path does not start. There is no second nomination this week.

Mrs. Vanguard
